INDICAZIONI ATTUALI ceftolozane/tazobactam

4.1 Indicazioni terapeutiche

è indicato per il trattamento delle seguenti infezioni negli adulti (vedere paragrafo 5.1):

- Infezioni intra-addominali complicate (vedere paragrafo 4.4);
- Pielonefrite acuta;
- Infezioni complicate del tratto urinario (vedere paragrafo 4.4);
- Polmonite acquisita in ospedale (HAP), inclusa polmonite associata a ventilazione meccanica (VAP).

Tabella 1: Dose per via endovenosa di [REDACTED] per tipo di infezione in pazienti con clearance della creatinina >50 mL/min

Tipo di infezione	Dose	Frequenza	Tempo di infusione	Durata del trattamento
Infezione intra-addominale complicata*	1 g ceftolozano / 0,5 g tazobactam	Ogni 8 ore	1 ora	4-14 giorni
Infezione complicata del tratto urinario Pielonefrite acuta	1 g ceftolozano / 0,5 g tazobactam	Ogni 8 ore	1 ora	7 giorni
Polmonite acquisita in ospedale, inclusa polmonite associata a ventilazione meccanica**	2 g ceftolozano / 1 g tazobactam	Ogni 8 ore	1 ora	8-14 giorni

*Da usare in associazione con metronidazolo se si sospetta la presenza di patogeni anaerobi.

**Da usare in associazione con un agente attivo antibatterico nei confronti di patogeni Gram-positivi, quando questi sono noti o sospetti nel contribuire al processo infettivo.

Scheda cartacea per la prescrizione della specialità medicinale (ceftolozano-tazobactam)**Diagnosi**

Infezione intra-addominale complicata (cIAI) con eziologia documentata/sospetta* da batteri Gram-negativi, resistente ai trattamenti di prima linea

(se si sospetta la presenza di patogeni anaerobi dovrà essere associato a metronidazolo)

Infezione complicata del tratto urinario (cUTI), inclusa la pielonefrite acuta, con eziologia documentata da batteri Gram-negativi resistenti ai trattamenti di prima linea

(Allegare antibiogramma)

Polmonite acquisita in ospedale (HAP), inclusa la polmonite associata a ventilazione meccanica (VAP), con eziologia documentata/sospetta* da batteri Gram-negativi resistenti ai trattamenti di prima linea

(da usare in associazione con un agente attivo antibatterico nei confronti di patogeni Gram-positivi, quando questi sono noti o sospetti nel contribuire al processo infettivo)

*L'infezione "sospetta" può essere considerata in pazienti selezionati sulla base di criteri epidemiologici, clinici e microbiologici (ad es. colonizzazione intestinale) in accordo a raccomandazioni terapeutiche definite dal programma di stewardship antibiotica del singolo ospedale.

* La prescrivibilità è riservata allo specialista infettivologo o, in sua assenza, ad altro specialista con competenza infettivologica ad hoc identificato dal Comitato Infezioni Ospedaliere (CIO) istituito per legge presso tutti i presidi ospedalieri (Circolare Ministero della Sanità n. 52/1985).

INDICAZIONI ATTUALI ceftazidime/avibactam

4.1 Indicazioni terapeutiche

è indicato per il trattamento delle seguenti infezioni negli adulti (vedere paragrafi 4.4 e 5.1):

- infezione intra-addominale complicata (cIAI)
- infezione complicata del tratto urinario (cUTI), inclusa pielonefrite
- polmonite acquisita in ospedale (HAP), inclusa polmonite associata a ventilazione meccanica (VAP)

è inoltre indicato per il trattamento di infezioni causate da microrganismi Gram-negativi aerobi in pazienti adulti nei quali vi siano opzioni terapeutiche limitate (vedere paragrafi 4.2, 4.4 e 5.1).

Si devono considerare le linee-guida ufficiali sull'uso appropriato degli agenti antibatterici.

Condizioni cliniche e criteri di rimborsabilità

Infezione complicata del tratto urinario (cUTI), incluse le pielonefriti, con eziologia documentata da batteri Gram-negativi resistenti ai trattamenti di prima linea (Allegare antibiogramma), compresa la batteriemia (solo negli adulti)

Infezione intra-addominale complicata (cIAI) con eziologia documentata/sospetta* da batteri Gram-negativi resistenti ai trattamenti di prima linea), compresa la batteriemia (solo negli adulti)

Polmonite acquisita in ospedale (HAP), inclusa polmonite associata a ventilazione meccanica (VAP), con eziologia documentata/sospetta* da batteri Gram-negativi resistenti ai trattamenti di prima linea, compresa la batteriemia (solo negli adulti)

Infezioni causate da microrganismi Gram-negativi aerobi in pazienti nei quali vi siano opzioni terapeutiche limitate, con eziologia documentata/sospetta* da batteri Gram-negativi, resistente ai trattamenti di prima linea

**L'infezione "sospetta" può essere considerata in pazienti selezionati sulla base di criteri epidemiologici, clinici e microbiologici (ad es. colonizzazione intestinale) in accordo a raccomandazioni terapeutiche definite dal programma di stewardship antibiotica del singolo ospedale.*

MEROPENEM/VABORBACTAM

g 2/2 ogni 8 ore x cl creat > 40 ml/min infusione 3 ore

Indicazioni terapeutiche negli adulti :

- infezione del tratto urinario complicata (cUTI), compresa pielonefrite**
- infezione intra-addominale complicata (cIAI)**
- polmonite nosocomiale (HAP), inclusa polmonite associata a ventilazione (VAP)**

Trattamento di pazienti con batteriemia che si verifica in associazione o in sospetta associazione con una qualsiasi delle infezioni sopra elencate

E' inoltre indicato per il trattamento di infezioni dovute a organismi Gram-negativi aerobi in adulti che dispongono di opzioni terapeutiche limitate

IMIPENEM/CILASTATINA/RELEBACTAM

mg 500/500/250 ogni 6 ore x cl creat 90-150 ml/min infusione 1/2 ora

Indicazioni terapeutiche negli adulti :

- Trattamento della polmonite acquisita in ospedale (HAP), compresa polmonite associata a ventilazione meccanica (VAP)
- Trattamento della batteriemia che si manifesta in associazione o che si sospetta sia associata a HAP o VAP
- Trattamento delle infezioni causate da organismi aerobi Gram-negativi con opzioni di trattamento limitate 

CEFIDEROCOL

Funzionalità renale nella norma (cl creat 90-120 ml/min) 2g ogni 8 ore
Clearance renale aumentata (cl creat >120 ml/min) 2g ogni 6 ore

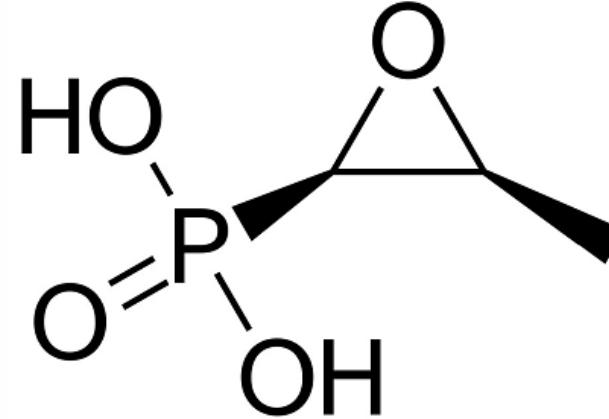

Infusione 3 ore

E' indicato per il trattamento delle infezioni dovute a organismi aerobi gram-negativi negli adulti con opzioni terapeutiche limitate

FOSFOMICINA infusiva

- infezioni ossee e articolari
- infezioni complicate del tratto urinario
- polmonite contratta in ospedale, compresa la polmonite associata a ventilazione
- meningite batterica
- endocardite infettiva
- infezioni complicate della cute e dei tessuti molli
- **infezioni complicate intra-addominali**
- batteriemia che si verifica in associazione con, o si sospetta sia associata a, qualsiasi delle infezioni sopra elencate

ERAVACICLINA

1 mg/kg ogni 12 ore per una durata da 4 a 14 giorni

1.5 mg/kg ogni 12 ore in caso di cosomministrazione di potenti induttori del CYP3A4

E' indicato per il trattamento di infezioni intra-addominali complicate (cIAI) negli adulti

Compromissione renale o epatica: NO aggiustamenti posologici

CARBAPENEM-RESISTANT ENTEROBACTERIALES (CRE)

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

QUESTION #5: *What is the treatment of choice for carbapenem-resistant Enterobacterales (CRE) infections?*

Recommendation 5.1:

In patients with infections caused by carbapenem-resistant Enterobacterales (CRE), rapid testing should be used to identify specific carbapenemase families (e.g. KPC, NDM, VIM, OXA-48-like). Clinicians should adopt different treatment strategies based on the type of causative carbapenemase-producing Enterobacterales (CPE).

Strength of recommendation: **STRONG** Certainty of evidence: **MODERATE**

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

Recommendation 5.2:

- 2.a In patients with infections caused by KPC-producing carbapenem-resistant Enterobacteriales (CRE), novel β -lactam agents such as **ceftazidime/avibactam** and **meropenem/vaborbactam** should be the first-line treatment options.
- 2.b Imipenem/relebactam and cefiderocol may also be considered.

2.a Strength of recommendation: **STRONG** Certainty of evidence: **MODERATE**

2.b Strength of recommendation: **CONDITIONAL** Certainty of evidence: **LOW**

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

Recommendation 5.3:

In patients with infections caused by OXA-48-like producing carbapenem-resistant Enterobacterales (CRE), ceftazidime/avibactam should be the first-line treatment option.

Strength of recommendation: **CONDITIONAL** Certainty of evidence: **VERY LOW**

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

Recommendation 5.4:

4.a In patients with infections caused by metallo- β -lactamase (MBL)-producing carbapenem-resistant Enterobacteriales (CRE), ceftazidime/avibactam plus aztreonam should be preferred.

4.b Cefiderocol may also be considered.

4.a Strength of recommendation: **STRONG** Certainty of evidence: **MODERATE**

4.b Strength of recommendation: **CONDITIONAL** Certainty of evidence: **LOW**

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

TARGETED COMBINATION TREATMENT

Recommendation 5.5:

There are **insufficient data** supporting or against the use of ceftazidime/avibactam as combination therapy or monotherapy.

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

QUESTION #6: What is the therapy of choice for infections caused by *Pseudomonas aeruginosa* with difficult-to-treat resistance (DTR-PA)?

Recommendation 6.1 : *In patients with invasive infections caused by *Pseudomonas aeruginosa* with difficult-to-treat resistance (DTR-PA), based on pre-clinical and clinical data, novel β-lactam agents such as *ceftolozane/tazobactam* and *ceftazidime/avibactam* are currently the first-line options for targeted treatment. *Imipenem/cilastatin–relebactam* and *cefiderocol* might be potential alternatives, as well as *colistin-based* therapy.*

Strength of recommendation: **STRONG** Certainty of evidence: **MODERATE**

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

TARGETED COMBINATION TREATMENT

Recommendation 6.2 : *In patients with invasive infections caused by *Pseudomonas aeruginosa* with difficult-to-treat resistance (DTR-PA), combination therapy should not be the routine choice but may be considered on a case-by- case basis, especially upon consultation with infectious diseases specialists. In particular, combination regimens including fosfomycin as companion agent could be considered.*

Strength of recommendation: **CONDITIONAL** Certainty of evidence: **LOW**

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

CARBAPENEM-RESISTANT ACINETOBACTER BAUMANNII (CRAB)

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

QUESTION #7: *What is the treatment of choice for carbapenem-resistant *Acinetobacter baumannii* (CRAB) infections?*

Recommendation 7.1 : There are *no convincing data* about the optimal antibiotic therapy against carbapenem-resistant *Acinetobacter baumannii* (CRAB) infections. Consultation by *infectious diseases specialists is needed* in patients with CRAB infections.

Strength of recommendation: **STRONG** Certainty of evidence: **MODERATE**

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

Recommendation 7.2 : *In patients who received colistin-containing regimens, kidney function should be strictly monitored because of the high risk of nephrotoxicity.*

Strength of recommendation: **STRONG** Certainty of evidence: **MODERATE**

Diagnosis and management of infections caused by multidrug-resistant bacteria: guideline endorsed by the Italian Society of Infection and Tropical Diseases (SIMIT), the Italian Society of Anti-Infective Therapy (SITA), the Italian Group for Antimicrobial Stewardship (GISA), the Italian Association of Clinical Microbiologists (AMCLI) and the Italian Society of Microbiology (SIM)

Tiseo G et al - Int J Antimicrob Agents 2022 Aug;60(2):106611

Recommendation 7.3 : *Cefiderocol represents a promising antibiotic option for patients with carbapenem-resistant *Acinetobacter baumannii* (CRAB) infections. Further studies are needed to consolidate this recommendation and to evaluate the use of cefiderocol as monotherapy or in combination with other antibiotics.*

Strength of recommendation: **STRONG** Certainty of evidence: **LOW**

European Society of Clinical Microbiology and Infectious Diseases (ESCMID) guidelines for the treatment of infections caused by multidrug-resistant Gram-negative bacilli (endorsed by European society of intensive care medicine).

Paul M et al - Clinical Microbiology and Infection 28 (2022) 521e547

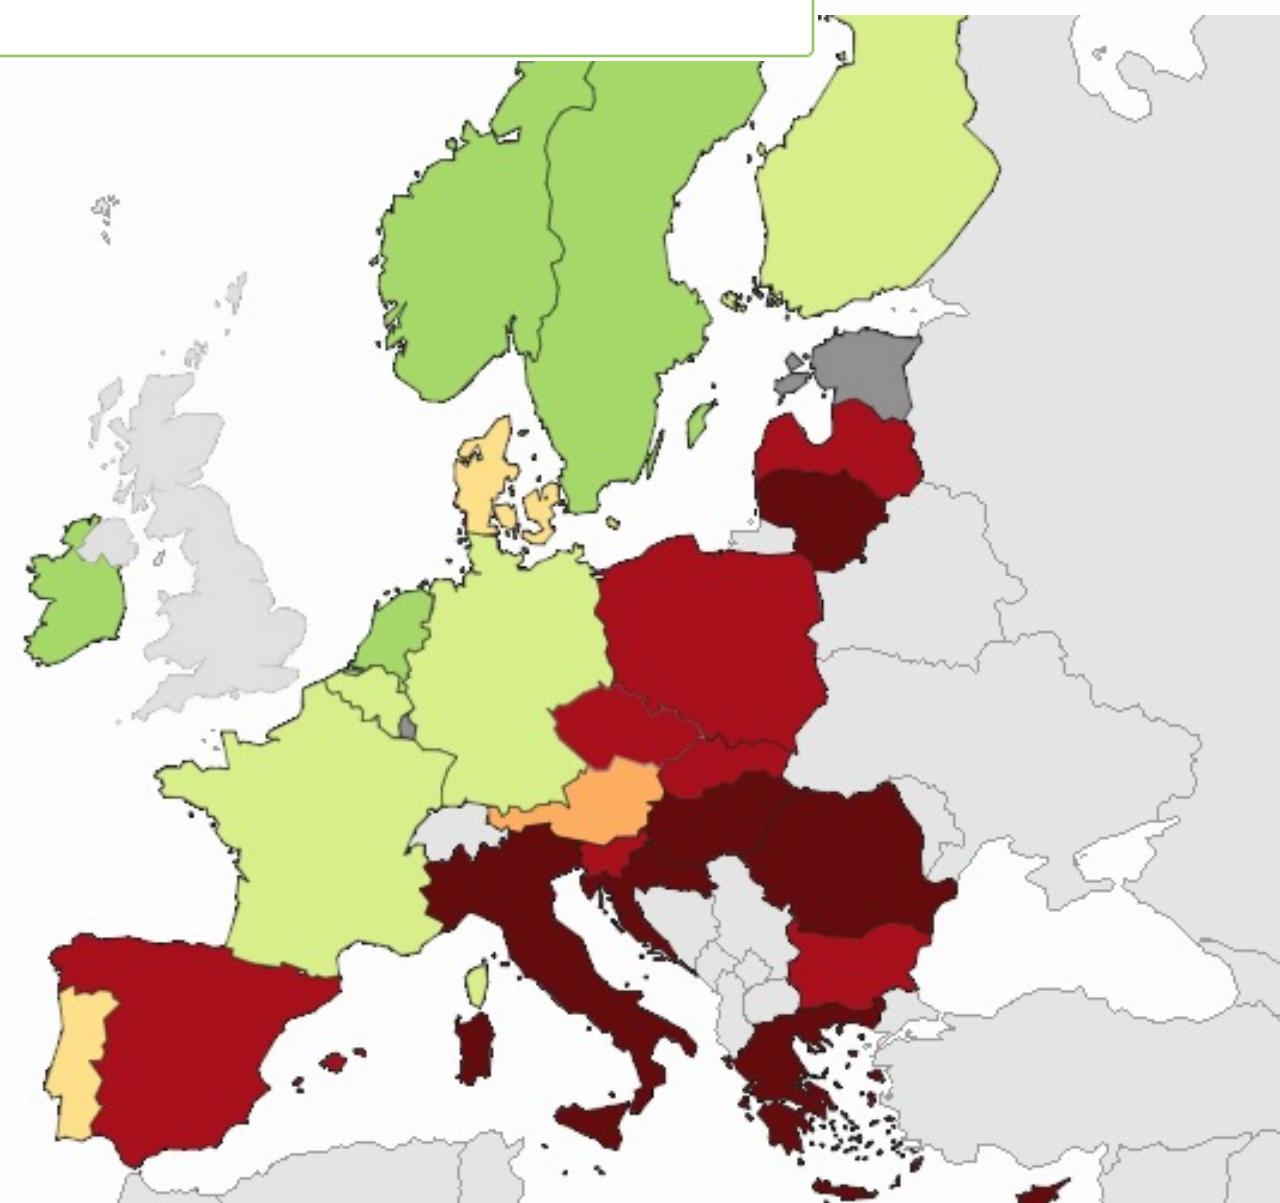

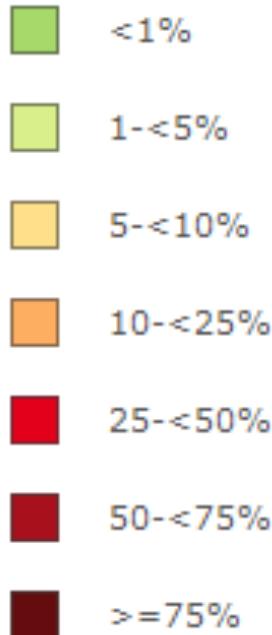

Recommendation	Strength of recommendation	Level of evidence
Carbapenem-resistant <i>Acinetobacter baumannii</i> (CRAB) Recommendations on the choice of antibiotic treatment for CRAB For patients with CRAB susceptible to sulbactam and HAP/VAP, we suggest ampicillin-sulbactam.	Conditional	Low
For patients with CRAB resistant to sulbactam, a polymyxin or high-dose tigecycline can be used if active <i>in vitro</i> . Lacking evidence, we cannot recommend on the preferred antibiotic.	No recommendation	
We conditionally recommend against cefiderocol for the treatment of infections caused by CRAB.	Conditional	Low
Recommendations on combination therapy for CRAB For all patients with CRAB infections, we do not recommend polymyxin-meropenem combination therapy or polymyxin-rifampin combination therapy.	Strong	High/moderate
For patients with severe and high-risk CRAB infections, we suggest combination therapy including two <i>in vitro</i> active antibiotics among the available antibiotics (polymyxin, aminoglycoside, tigecycline, sulbactam combinations).	Conditional	Very low
For patients with CRAB infections with a meropenem MIC ≤ 8 mg/L, we consider carbapenem combination therapy, using high-dose extended-infusion carbapenem dosing, as good clinical practice.	Good practice statement	Expert opinion
All carbapenem-resistant Gram-negative bacteria For pan-resistant CR-GNB (resistant also to polymyxins), treatment with the least resistant antibiotic/s based on MICs relative to the breakpoints is considered as good clinical practice.	Good practice statement	Expert opinion

ESCMID guidelines

Recommendation

Carbapenem-resistant *Acinetobacter baumannii* (CRAB)

Recommendations on the choice of antibiotic treatment for CRAB

For patients with CRAB resistant to sulbactam, a polymyxin or high-dose tigecycline can be used if active *in vitro*. Lacking evidence, we cannot recommend on the preferred antibiotic.

We conditionally recommend against cefiderocol for the treatment of infections caused by CRAB. !!!!!!!

Recommendations on combination therapy for CRAB

For patients with severe and high-risk CRAB infections, we suggest combination therapy including two *in vitro* active antibiotics among the available antibiotics (polymyxin, aminoglycoside, tigecycline, sulbactam combinations). !!!!!!!

Question 3: What Is the Role of Ampicillin-Sulbactam for the Treatment of Infections Caused by CRAB?

Suggested Approach

High-dose ampicillin-sulbactam is a preferred therapy for CRAB infections when susceptibility has been demonstrated.

High-dose ampicillin-sulbactam remains a treatment consideration as a component of combination therapy even when susceptibility has not been demonstrated.

In Vitro Activity of Sulbactam–Durlobactam against Carbapenem-Resistant *Acinetobacter baumannii* Clinical Isolates: A Multicentre Report from Italy

Table 1. In vitro activities of sulbactam–durlobactam and comparators against 141 carbapenem-resistant *Acinetobacter baumannii* collected in Italy.

/ = the number of isolates equal to zero. –, no values available. In SUL-DUR combination, DUR was at fixed concentration of 4 mg/L.

CONCLUSIONS

Wise use of classic anti-microbials (antimicrobial stewardship)

**Wise use of new anti-microbial
MDR/XDR/DTR strains**

**Inhaled antibiotics (selected situations)
XDR strains**

Combination treatment (maybe sometimes)

THE PRESENT

New antibiotics (now in phase I, II, III trials)

New Inhaled antibiotics

Biological agents

Vaccines

Phage therapy

THE FUTURE
